HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Formation of low-valent Fe⁰ and Fe^I species in Fe-catalyzed cross-coupling chemistry: key role of ate-Fe^{II} intermediates

Ate-iron(II) species such as [Ar₃Fe^{II}]⁻ (Ar = aryl) are key intermediates in Fe-catalyzed cross-coupling reactions between aryl Grignard reagents (ArMgX) and organic electrophiles.^[1] They can be active species in the catalytic cycle,^[2] or lead to Fe⁰ and Fe^I oxidation states. These low oxidation states were shown to be catalytically active in some cases, but they mostly lead to unwished organic byproducts.^[3,4]

This work relates a study of the evolution of [Ar₃Fe^{II}]⁻ complexes towards Fe⁰ and Fe^I oxidation states, through ¹H NMR, EPR and ⁵⁷Fe-Mössbauer spectroscopies, as well as DFT calculations, so as to discuss the role of both steric parameters and spin states in the reduction processes. Such mechanistic insights give a better understanding of iron-catalyzed C-C bond formation reactions, and can be exploited in the design of new ligands in order to selectively obtain a sole iron oxidation state in a catalytic process.

Figure 1: Pathways connecting ate-Fe^{II} (Mes = 2,4,6-trimethylphenyl) species with Fe⁰ and Fe^I oxidation states
