HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Experimental and theoretical investigations of spectroscopic properties of azobenzene derivatives

A series of azobenzenes was studied using ab initio and DFT methods to determine the substituent effects on the ground and electronically excited states. Azobenzene molecule is known to undergo a photoisomerization from trans to cis conformation upon irradiation by light. The aim of the presentation is twofold. Firstly, we analyze different methods of calculations of electronic excitations of azobenzene molecule by comparing the results with experimental data. Secondly, we present the results of calculations of the UV-Visible spectra of azobenzene derivatives (e.g. Figure 1) and analyze the nature of the experimentally observed excitations.

Figure 1: Disperse Orange 3 TD-DFT/CAM-B3LYP vs. experimental UV-Visible spectra
