

Post-processing: coming next in SALOME

Cédric Aguerre – EDF Lab Paris-Saclay
Adrien Bruneton – CEA Saclay
Clarisse Genrault – CEA Saclay

SALOME User Day 2016
EDF Lab Paris-Saclay

December 9th 2016

AGENDA

1. MEDCALC

A FIRST LEVEL ACCESS TO PROCESSING AND VISUALIZATION
FEATURES OF MESHES AND FIELDS IN SALOME

2. CURVEPLOT

HIGH LEVEL MATPLOTLIB ACCESS INTO SALOME

MEDCALC

MEDCALC? A WORK IN PROGRESS

- **Load, process and visualize meshes and fields from the same SALOME module**
 - Integrate PARAVIS viewers w/o exposing the full ParaView GUI
 - Take advantage of the power of MEDCoupling and PARAVIS combination
 - Provides arithmetic functions on fields

- « **Easy to use** »
 - GUI exposing essential functions with PARAVIS look and feel
 - A dedicated Python API: you can dump!
 - **Finally, need advanced operations?**
 - Switch to PARAVIS in a second!
 - The pipeline is already there!
- 
- Intro
Presenta

MEDCALC: GUI OVERVIEW

SALOME 8.1.0 - [Study1]

File Edit View Presentations Processing Tools Window Writers CoProcessing Help

Time: 172.4750670742 14 (max is 15)

Object Browser

- NAME
- PRESSION_ELEM_DOM (ON_CELL)
- Scalar map (7)
- VITESSE_ELEM_DOM (ON_CELL)
- Scalar map (8)
- VITESSE_SOM_DOM (ON_NODE)
- Mesh view (4)
- INTERFACES
- Demo_2.med
- MAIL
- MODES_DEPL
- Scalar map (23)
- Slices (24)

Workspace

Name	Value
Mesh_qu...	No value
Mesh...	No value
it ...	No value

Presentation parameters

Slices (24)

Range: All timesteps

Color map: Blue to red rainbow

Displayed component: Euclidean norm

Number of slices (max): 5

Slice orientation: Normal to Z

Python Console

```
24
>>> params = medcalc.GetSlicesParameters(24)
>>> params.nbSlices = 5
>>> medcalc.UpdateSlices(24, params)
>>> params = medcalc.GetSlicesParameters(24)
>>> params.orientation = MEDCALC.SLICE_NORMAL_TO_Z
>>> medcalc.UpdateSlices(24, params)
>>>
```

MEDCALC: PYTHON SAMPLE

```
>>> source_id = medcalc.LoadDataSource('/local00/home/F62173/testfiles/Demo_2.med')

>>> presentation_id = medcalc.MakeMeshView(medcalc.GetFirstMeshFromDataSource(source_id),
                                           viewMode=MEDCALC.VIEW_MODE_NEW_LAYOUT)

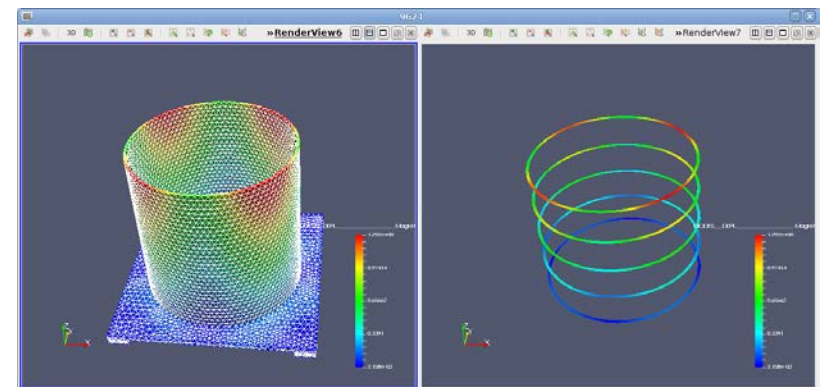

>>> presentation_id = medcalc.MakeScalarMap(accessField(80),
                                           viewMode=MEDCALC.VIEW_MODE_OVERLAP)

>>> presentation_id = medcalc.MakeSlices(accessField(80),
                                           viewMode=MEDCALC.VIEW_MODE_SPLIT_VIEW)

>>> params = medcalc.GetSlicesParameters(presentation_id)
>>> params.orientation = MEDCALC.SLICE_NORMAL_TO_Z
>>> params.nbSlices = 5
>>> medcalc.UpdateSlices(22, params)
```

Each GUI action triggers
a python function call

MEDCALC: PRESENTATIONS

MEDCALC! THERE IS WORK TO BE DONE!

- **Still a prototype to be beta-tested (SALOME 8.2)**

- Presentations with minimal settings
- Modes and animations
- Memory-passed objects
- ParaView pipeline – switch to PARAVIS
- GUI and scripting

- **Roadmap 2017**

- Concept validation thanks to user feedback
- Dataspace / workspace interaction
- MEDCoupling visibility enhancement

CURVEPLOT

CURVEPLOT

Some history and background

- At CEA, several business projects use the “old” C++ Plot2D, based on Qwt
- Problem: some divergence/forks in the code!
 - New/modified functionalities/API
 - Not reversed in the main stream
- In general, current tool is not obvious to maintain and to change
- Hazardous mix between Qwt API and pure PLOT2D API
- From recent SALOME versions, we benefit from the *de-facto* integration of *matplotlib*
 - *matplotlib* provides an easy to manipulate API and most wanted services

matplotlib

SPECIFICATIONS

Main needs around a plotting tool

- Obviously, plotting 2D curves!
- No 3D: ParaVis is already there! And MED visualization is almost ready too.
- Curve related functionalities
 - Overlapping curves
 - Various representation modes (log, color, etc ...)
- Why not use Paraview's capabilities ?
 - Not user-friendly enough for business module developer
 - Too heavy: requires ParaView loading!
 - Harder to interface with custom file formats (XML, .data, ...)

Start minimal and grow only if needed! (similar to MEDCalc)

IMPLEMENTATION & API

Implementation

- Full Python (like *matplotlib*), with PyQt4 backend
 - With a C++ wrapping (using internal SALOME interpreter)

- Public API does not expose MVC design. Only simple commands
 - `AddCurve`, `DeleteCurve`
 - `AddPlotSet`, `DeletePlotSet`
 - `SetCurveMarker`, `SetXLog`, `SetCurveLabel`

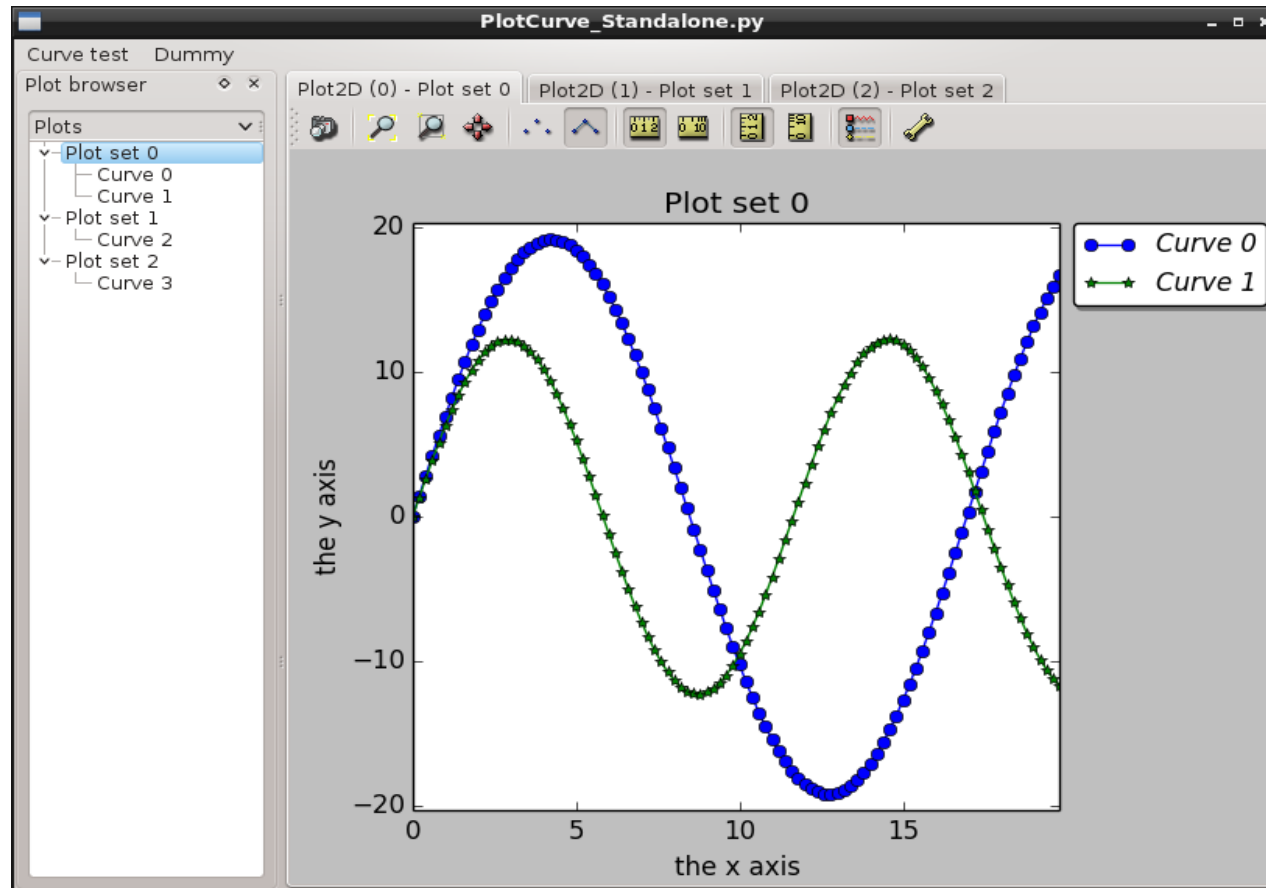

- Main parameters: unique curve identifier (=an integer), and a unique plot set identifier

- Testing part: ~45 unit tests with screenshot comparison

SOME SCREENSHOTS (1/2)

XMax :

☐ Scientific notation

CONCLUSION & TODO LIST

Conclusion

- Simple interface to most commonly requested plotting facilities
- *matplotlib* completely encapsulated
- New functionalities: finer handling of curves (changing colors, markers, etc ...)

On-going work

- Have a full dedicated SALOME module using the tool
 - Loading files in a table, etc ...
 - Potentially create/modify columns, using PANDAS for example
 - And obviously plot the data loaded this way
- Major expected improvements
 - Double Y axis (was in former Plot2D and is needed at CEA)
 - Performance optimization: not as efficient as pure *matplotlib* yet
