HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
Investigation of capillary ion chromatography (Cap-IC) for nuclear prospects

The recent development of commercial capillary ion chromatography (Cap-IC) systems [1-4] provides a major opportunity to increase the reactivity of laboratories and to reduce the amount of radioactive effluents produced from the chromatographic analyses in the nuclear field. As the column replacement in a radioactive environment is tedious, the retention behavior of IC columns was investigated at capillary scale to anticipate this operation.

Evolution of retention behavior of Cap-IC columns

→ Linear decrease of retention factors as a function of the operating time of the Cap-IC columns whatever the type of columns and the studied anions

≠ no decline for cation-exchange Cap-IC columns

Validation of Cap-IC

→ Accurate quantification of all anions by using the same calibration curve during 18 days

→ No bias observed for the two laboratories using Cap-IC whatever the analyzed anions

Novel aspect

Despite the linear decrease of retention factors observed for anions, the analytical performance of capillary ion chromatography was validated with an interlaboratory comparison exercise, which makes this technology convenient for applications to radioactive samples. This work is of prime interest for nuclear analysts but also for IC users who intend to increase the flexibility and the reactivity of their laboratories.
