Submitted on 24 Feb 2020

HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

13th Tihany Symposium on Radiation Chemistry
29th August-3rd September 2015

A repository disposal diagram:

- **Long-term degradation ($\approx 1,000$ years): radiolysis *and* alkaline hydrolysis**
- Question: what is the effect of water-soluble products on the radionuclides mobility?

Considered polymer

- Poly(ester urethane) (PUR)
- Used as glove for glove boxes

- Composed of 3 segments issued from these molecules

hard segment

↓
25.5%_w

extender

soft segment

↓
63.4%_w

+ 8.9% inorganic fillers
+ 1.8% cross linking agents
+ 0.4% pigments

Objectives

- Characterizing and quantifying water-soluble molecules created by the alkaline hydrolysis of the non-irradiated and irradiated PUR at different doses

- Understanding the degradation mechanisms
 - PUR under radiolysis
 - Irradiated PUR under hydrolysis

- Identifying the products than can complex with the radionuclides

- Being able to model the complexant release kinetics

Objectives

Characterizing and quantifying water-soluble molecules created by the alkaline hydrolysis of the non-irradiated and irradiated PUR at different doses

Understanding the degradation mechanisms

- **PUR under radiolysis**
- **Irradiated PUR under hydrolysis**

- Identifying the products than can complex with the radionuclides
- Being able to model the complexant release kinetics

A two-step preparation

- **1st step:** PUR is irradiated under air using γ rays by IONISOS (^{60}Co source), dose rate: $\sim 0.7 \text{ kGy.h}^{-1}$, doses: 4 MGy (~ 8 months irradiation) and 10 MGy (~ 20 months irradiation)
- **2nd step:** non-irradiated and irradiated PUR is then hydrolyzed and the pH is maintained constant = **leaching**

RESULTS AND DISCUSSION

Analytical approach

Leachate

Total Organic
Carbon analysis
TOC analyzer

Targeted analyses
of **low** molecular
weight molecules
($< 2\,000$ Da)

Targeted analyses
of **high** molecular
weight molecules

Organic acids
IC

Volatile and semi-
volatile organic
molecules
GC-MS

Other organic
molecules
LC-MS
MS-MS

Weight average
molecular
SEC

RESULTS AND DISCUSSION

Analytical approach

■ **Total Organic Carbon = TOC, ionic chromatography → carboxylic acids quantification**

Material balances obtained for leachates in **pure water**:

0 MGy

0.26 mol C/kg of PUR

4 MGy

8.53 mol C/kg of PUR

10 MGy

17.7 mol C/kg of PUR

- acetic acid
- formic acid
- glutaric+succinic acids
- malonic acid
- adipic acid
- oxalic acid
- unknown

Material balances obtained for leachates in **cementitious water**:

0 MGy

20.2 mol C/kg of PUR

4 MGy

26.1 mol C/kg of PUR

10 MGy

29.5 mol C/kg of PUR

**Origin of adipic acid :
PUR soft segment**

There is a need to investigate the leachates by other analytical techniques.

RESULTS AND DISCUSSION

Gas chromatography-mass spectrometry

Molecules detected in the **10 MGy irradiated PUR leachate in pure water**

■ Some molecules are directly identifiable in the polymer formula :

↓
soft segment

↓
extender

↓
hard segment

■ Other molecules are due to chain scission or chain ends radio-oxidation, or due to ester groups hydrolysis and rearrangements.

RESULTS AND DISCUSSION

Gas chromatography-mass spectrometry

Molecules detected in the **10 MGy irradiated PUR leachate in pure water**

■ Some molecules are directly identifiable in the polymer formula :

soft segment

extender

hard segment

■ Other molecules are due to chain scission or chain ends radio-oxidation, or due to ester groups hydrolysis and rearrangements.

■ An example of a degradation mechanism:

■ Goals of the study:

- Characterizing and quantifying water-soluble molecules created by the alkaline hydrolysis of the non irradiated and irradiated PUR
- Understanding the degradation mechanisms
 - PUR under radiolysis
 - Irradiated PUR under hydrolysis

- Ionic chromatography + TOC analyzer = material balance, **but** the material balances are not complete. **Solution** → developing other analytical techniques such as:
 - Gas chromatography coupled with mass spectrometry

■ Results:

- New molecules detected: the knowledge of released molecules is improved
- Identification of the molecules origin
 - Fragments of the polymer formula
 - Compounds obtained by chain scission, chain ends oxidation, ester groups hydrolysis or/and rearrangements

=> *Better understanding of the mechanisms of irradiation and of leaching*

■ Perspectives:

- Quantifying the molecules detected by GC-MS
- Identifying the molecules than can complex with the radionuclides
- Following the complexant release kinetics

=> *Irradiated PURm hydrolysis mechanisms to be proposed*

**Do you have
any questions?**

Thank you for your attention.

ACKNOWLEDGMENT

This work has been financed by AREVA.

**Thanks to S.Rouif (IONISOS) for her helpful
collaboration during irradiation.**

**Thanks to V. Dauvois, E. Zerki, M. Tabarant,
S.Sandirin, J.L. Roujou, A.Turban, D. Durand for
their ideas and technical help.**
