HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Study of accuracy profiles for different elements by ICP-AES and ICP-MS

Context and purpose

The accuracy profile is a graphical representation of accuracy depending on the concentration, that is to say the variation of both the trueness (bias) and precision. This profile reflects the ability of the instrument to work with an accuracy tolerance in a concentration range given.

Accuracy profiles represent a possible statistical tool for the interpretation of validation studies.

The objective of this work was to examine the accuracy profile of different elements by ICP-AES and ICP-MS. This study is based on the use of reference materials and takes into account the internal repeatability and the inter-day reproducibility.

Theory of accuracy profile

Accuracy is the sum of the trueness expressed by a bias or a recovery yield and the precision expressed by a standard deviation modified by a coverage factor (or Mee factor). In our case of intralaboratory testing, precision correspond to the intermediate precision.

In practice : $\text{accuracy} = \text{bias}^* \pm k_s \cdot S_R$ * or recovery yield % (= experimental value / reference value)

with k_s : coverage factor or Mee factor and S_R : standard deviation of intermediate precision

It is necessary to calculate S_R and k_s

❖ intraday repeatability : serie of determinations in the same day \Rightarrow standard deviation S_r

❖ interday reproducibility : day by day independent series \Rightarrow standard deviation S_L (1 serie = 1 day)

$$S_r^2 = \frac{SCE_{intraday}}{p(n-1)}$$

$$S_L^2 = \frac{1}{n} \left(\frac{SCE_{interday}}{p-1} - S_r^2 \right)$$

$$S_R^2 = S_r^2 + S_L^2$$

\Rightarrow SCE : Sum of squares of deviations from an average,

\Rightarrow p : number of series (or days) and n : number of determinations by serie (or day).

$$k_s = t \cdot C$$

t is the Student factor for a degree of freedom (ddl).

It is necessary to calculate C :

$$H = \frac{S_r^2}{S_r^2}$$

$$G^2 = \frac{H+1}{nH+1}$$

$$C = \left(1 + \frac{1}{npG^2} \right)^{1/2}$$

You have to know the degree of freedom, ddl = $\frac{(H+1)^2}{\frac{H+1}{p-1} + \frac{1-n}{np}}$

As ddl is not an integer, it is necessary to interpolate linearly t (in relation to Student's t distribution table)

Analysis by ICP-AES

Varian Vista Pro apparatus

Seaspray nebulizer, cyclonic chamber, axial view, CCD detector

Operating conditions :

Conditions d'utilisation pour Toutes les séries	
Eau (l/h)	1.30
Débit Plasma (L/h)	15.0
Débit auxiliaire (L/h)	1.50
Pression Nebulisateur (Pa)	2000
Temps lecture par série (s) : 10.00	
Délai Stabilisation (s)	90
Paramètres d'introduction de l'échantillon	
Délai de prélèvement (s)	50
Vitesse de purge (l/min)	50
Temps de rinçage (s)	10
Échantage rapide (Introduction/Échantage)	
Échantage normal	Échantage optimisé
Paramètres généraux	
Débitique	1

Analysis by ICP-MS

Varian 820 MS apparatus

Micro-concentric nebulizer, Scott spray chamber cooled to 3°C with Peltier effect, DDEM detector

Operating conditions :

Parameters	Value
Flow Parameters (L/h)	
Plasma Flow	15.0
Auxiliary Flow	1.50
Sheath Gas	0.24
Nebulizer Flow	1.90
Tech-Alignment (mm)	
Sampling Depth	6.5
Other	
RF Power (kW)	1.40
Pump Rate (rpm)	6
Stabilization delay (s)	60
Opt-Detector (cm)	
First Extraction Lens	-1
Second Extraction Lens	-207
Third Extraction Lens	-252
Cones Lens	-395
Minor Lens Left	48
Minor Lens Right	38
Minor Lens Bottom	32
Entrance Lens	0
Fringe Bias	-2.5
Entrance Plate	-35
Pole bias	0.0

Results

Conclusions

- ✓ This work enabled access to the **limits of quantitation** of various elements analysed and permitted to evaluate the **measurement uncertainties** in the concentration range studied : important parameters within the context of **method validation**.
- ✓ A **comparison of the results** obtained by the **two techniques** has allowed to highlight the performance of each device, since the method of the accuracy profile enables to observe actually the **capabilities of the instrument** and of the method.
- ✓ Examples of results obtained in the **method validation** framework for different analytical programs were used to illustrate **the theme of the accuracy profile**.
