HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Towards a Laser-IMS tool for the real-time detection of adsorbed compounds

IMS remains the reference technic for real-time sensitive detection of toxic and explosives. Numerous extension of the original method have been proposed [1, 2].

In this communication, we tested the coupling of an IMS with an ultrafast laser source. Such sources are used routinely in surface abrasion and decontamination. We tested if such processes could be coupled to a real-time IMS thus providing a coupled analysis/decontamination strategy.

We compared the IMS signal under laser irradiation with the one from thermo-desorption on porous substrates of different colors.
